

Program		Type of studies (cycle)	Third cycle		
		Name of the program	SEE Doctoral Studies in Mathematical Science		
<b>Course</b>					
Course title		<b>Spectral graph theory</b>			
Course code	Semester	Course status	ECTS credits	Contact hours	
	II		10	30	
Teaching staff	Teacher	Doc. Dr. Almasa Odžak			
	Other staff				
Course goals	<p>The main goal of the course is to introduce basic aspects and techniques in spectral graph theory. Graphs are common models which appear in different areas of pure or applied mathematics, physics, chemistry, and computer science. During the last few decades special attention is devoted to research on quantum graphs, since they are natural models for many phenomena appearing in different scientific areas. A quantum graph identifies edges of a combinatorial graph with closed intervals and in addition it has a differential (or pseudo-differential) operator acting on functions defined on the collection of intervals.</p> <p>Quite useful tool for the investigation of graphs and their properties are matrices attached to graphs such as adjacency matrices or Laplacian matrix, or spectra of graph. These are central objects in spectral graph theory. Important tool used to analyze spectrum of quantum graphs are trace formulas on graphs.</p>				
Course content/topics					
<ul style="list-style-type: none"> <li>• Laplacian of graphs</li> <li>• Spectra of graphs</li> <li>• Graph characterization using spectra</li> <li>• Operations on graphs and the resulting spectra</li> <li>• Quantum graphs</li> <li>• Operations on quantum graphs</li> <li>• Spectra of quantum graphs</li> <li>• Trace formulas on graphs</li> <li>• Weil's low for graphs</li> </ul>
